IT is surprising the different types of homes on which "CREO-DIPT" Stained Shingles for thatched roofs are shown to good advantage.

In this book we have selected representative homes from suburban and city residences in all sections of the country on which "CREO-DIPT" thatched roofs have been used.

They are being specified continually on country homes, farm buildings, large estates, on club houses, mountain camps and shore homes.

There seems to be no particular type of brick, stucco, or shingle work with which the thatched roof does not harmonize.

“CREO-DIPT” Dixie White

for whitewashed effect on side walls

IT is with gratification that we call special attention to the success we have had in the development of our “CREO-DIPT” Dixie White—a white shingle stain for whitewashed effect.

The difficulties met with in producing the Southern whitewashed effect have been to avoid an unreasonable expense in securing and handling a material that would not result in the painty effect, and would secure the true effect of whitewash that would not rub off.

“CREO-DIPT” Dixie White Stained Shingles have found favor as, by our process at our factories, we can carry the preparatory treatment which is known as No. 207 into the pores of the shingles with our creosote medium, securing not only a preserving effect, but an even body as a filler, primer and binder.

For the whitewashed effect the “CREO-DIPT” Stained Shingles are delivered to the premises in bundles ready to lay without waste, all treated in No. 207. The true whitewashed effect is then obtained by applying “CREO-DIPT” Dixie White Stain over the exposed surface of “CRE-ODIPT” Stained Shingles after they have been laid. This is the only practical method of obtaining the real whitewashed effect. Every other white stain process requires several brushcoats, with the result that the soft, whitewashed effect is lost, and the gummy, white paint effect is all too apparent.

An attractive color scheme for the white side walls would be a moss green “CREO-DIPT” Stained Shingle roof with blinds to match the roof, and white trim throughout.

This treatment for Colonial houses, for country and summer homes, is especially admired because it shows in charming glimpses from a distance through its environment of trees and shrubbery. It also affords a pleasing picture when the leaves have fallen, for the bare boughs tend to soften the wintry aspect.

“CREO-DIPT” Dixie White is a lasting, permanent, preserving stain.

Use 24-inch “CREO-DIPT” Stained Shingles

for the wide shingle exposure effect

The old fashioned shingles of Colonial days did not have the attracting appearance of the 24-inch “CREO-DIPT” Stained Shingles. These large “CREO-DIPT” Stained Shingles give an artistic effect, and a repair and paint economy never before realized. They have heavy butts, and, being laid with an exposure of from eight to eleven inches to the weather, not only look well, but they do not curl or bend, and they possess the protective value of air spaces between the different shingle laps.

With clapboards and other side wall material, air spaces open straight through to the inner walls. This does not happen with "CREO-DIPT" Stained Shingles, which are laid to "break joints." They make a more weather tight and non-conductive siding for that reason. Their greatest value, however, lies in their greater economy with lasting stain, which saves painting and repair expenses.

"CREO-DIPT" Stained Shingles in the Dixie White or in any of the many shades of green, brown, gray or red, never lose their charm, because they do not have to be obliterated by coats of paint. They last a lifetime, as they are preserved against dry rot and weather.
